

Dear Hiring Team,

I'm excited to apply for the AI Product Intern role. As a final-year Computer Science student specializing in Machine Learning and Android development, I've been actively building and shipping AI-driven products—not just learning about them.

What stands out about my experience is that I've already worked across the full lifecycle of AI product development. For example, I built *HAAi*, an AI-powered health assistant app currently in Google Play Store closed testing, where I integrated LLM APIs to generate contextual health insights. This involved not just engineering, but also defining features, testing outputs, and iterating based on usability—exactly the kind of ownership your role requires.

I've also developed *RepoScope*, a full-stack analytics platform combining rule-based systems with LLM interpretation to evaluate GitHub repositories. This project pushed me to think like a product builder—designing meaningful metrics, creating dashboards, and ensuring outputs were both accurate and explainable.

Beyond building, I'm very comfortable experimenting and iterating quickly. I regularly work with tools like ChatGPT, APIs, and prompt engineering techniques to test edge cases and improve output quality. With 40+ public repositories, I'm used to shipping fast, learning from feedback, and continuously refining what I build.

What I bring to this role:

- Hands-on experience integrating and evaluating AI models in real products
- A strong bias toward shipping, measuring, and improving
- Comfort with data, experimentation, and rapid iteration
- Curiosity to talk to users and turn feedback into better product decisions

I'm particularly excited about this role because it sits at the intersection of engineering, product, and growth—areas I've naturally gravitated toward through my projects.

I'd love the opportunity to contribute, experiment, and help build impactful AI products with your team.

Best regards,

Midhun KP
